
Announcements

- ❖ Please log on Canvas before class
- ❖ **Project 0**: Python Tutorial
 - ❖ Due next Monday
 - ❖ Don't wait for last moment!
- ❖ **HW 1** will also be released on next Monday
- ❖ **Project 1** will also be released on next Wednesday
- ❖ **Survey** for deciding OHs and Recitation times
 - ❖ Respond by the end of the week
 - ❖ OH and Recitation start next week
- ❖ **Survey** for flipped classroom

Ve492: Introduction to Artificial Intelligence

Agents and Environments

Paul Weng

UM-SJTU Joint Institute

Slides adapted from <http://ai.berkeley.edu>, AIMA

Outline

- ❖ Agents and Environments
- ❖ PEAS (Performance measure, environment, actuators, sensors)
- ❖ Environment types
- ❖ Agent types
- ❖ Complexity

Agents and Environments

What is an Agent?

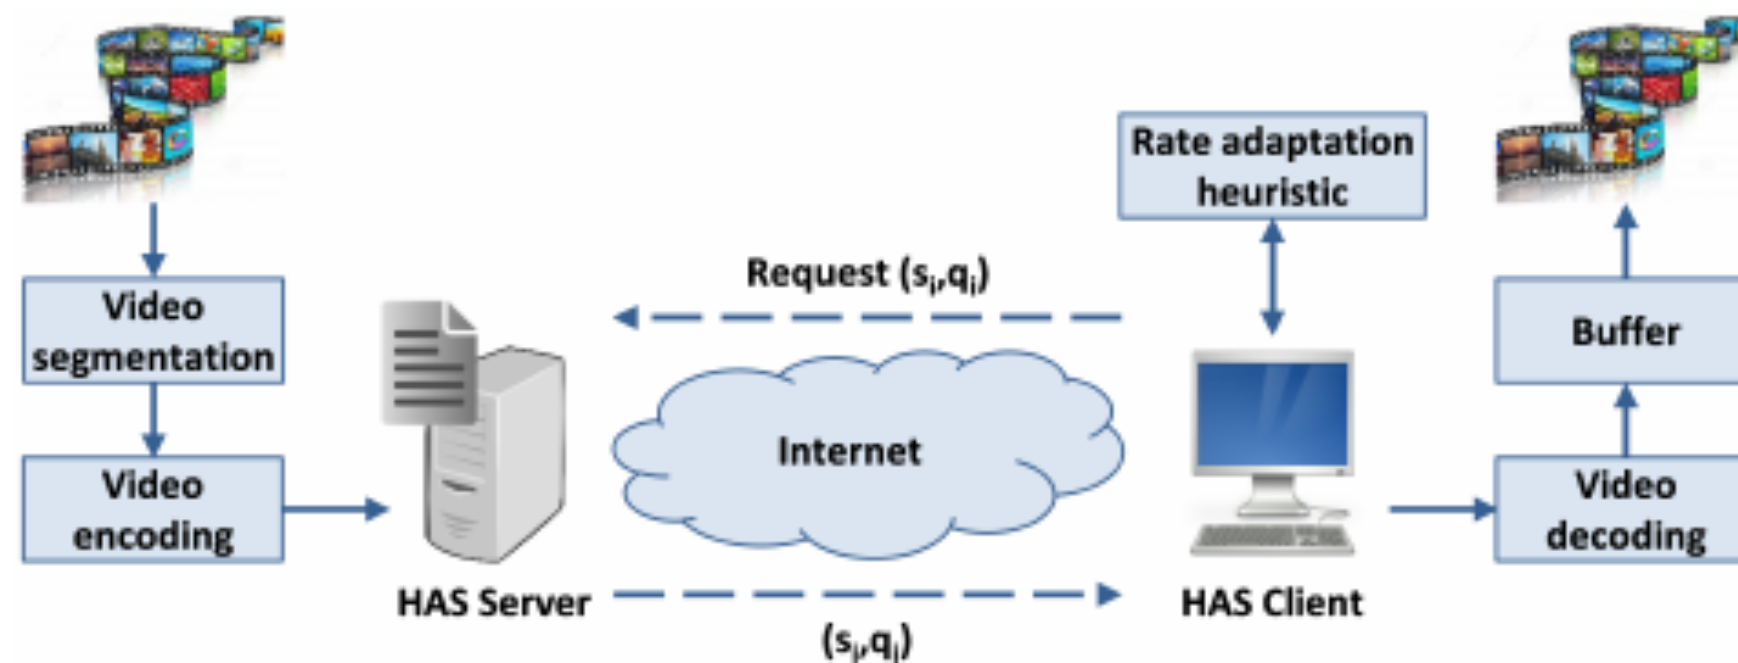

- ❖ **Agents:** humans, robots, software, cars...
- ❖ **Mathematical view:**
 - ❖ Function from percept or percept sequence to action
- ❖ **CS view:**
 - ❖ Program that takes a percept as an input and returns an action

Example: Vacuum Cleaner

- ❖ What are the percepts?
 - ❖ Readings from sensors
 - ❖ Location
 - ❖ Dirt detection
 - ❖ Obstacle detection
- ❖ What are the actions?
 - ❖ Move, brush, vacuum

Example: Adaptive Video Player

Huysegems et al. 2015

- ❖ What are the percepts?
 - ❖ Network conditions
- ❖ What are the actions
 - ❖ Request of the most suited quality version of the next video chunks

Example: Autonomous Trader

- ❖ What are the percepts?
 - ❖ Financial prices
 - ❖ Economic data
 - ❖ News
- ❖ What are the actions?
 - ❖ Buy / sell / hold stocks

Recommender Systems

- ❖ What are the percepts?
 - ❖ User's search query
 - ❖ User's previous interactions (clicks, page views, purchases...)
 - ❖ User's information
- ❖ What are the actions?
 - ❖ Product lists

How to Select Actions?

- ❖ What is the right function from intercepts to actions?
 - ❖ Performance measure for environment sequence
 - ❖ 1pt per m^2 cleaned in time T
 - ❖ 1pt per m^2 cleaned / time step
 - ❖ -1pt per dirty m^2
- ❖ Can it be implemented as a small/efficient program?

Rationality

- ❖ Being rational = maximizing “expected utility”
- ❖ What is rational depends on:
 - ❖ Agent’s prior knowledge of environment
 - ❖ Current percept sequence
 - ❖ Actions available to agent
 - ❖ Performance measure

Rational Agents

- ❖ Are rational agents omniscient?
 - ❖ No - they are limited by the available percepts and limited prior knowledge
- ❖ Are rational agents clairvoyant?
 - ❖ No - they may lack knowledge of the environment dynamics
- ❖ Do rational agents explore and learn?
 - ❖ Yes - in unknown environments these are essential
- ❖ So rational agents are not necessarily successful, but they are autonomous

PEAS

- ❖ To design a rational agent, we must specify the **task environment**
- ❖ Consider, e.g., the task of designing an automated taxi:
- ❖ **Performance measure**
 - ❖ Safety, destination, profits, legality, comfort, ...
- ❖ **Environment**
 - ❖ Streets / highway, traffic, pedestrians, weather...
- ❖ **Actuators**
 - ❖ Steering, brake, accelerate, display / speaker...
- ❖ **Sensors**
 - ❖ Camera, radar, accelerometer, engine sensors, microphone...

PEAS for Recommender System

- ❖ Performance measure

- ❖ CTR (Click-Through-Rate), profits, happy customer...

- ❖ Environment

- ❖ Users, products

- ❖ Actuators

- ❖ Product lists

- ❖ Sensors

- ❖ Database accesses, APIs

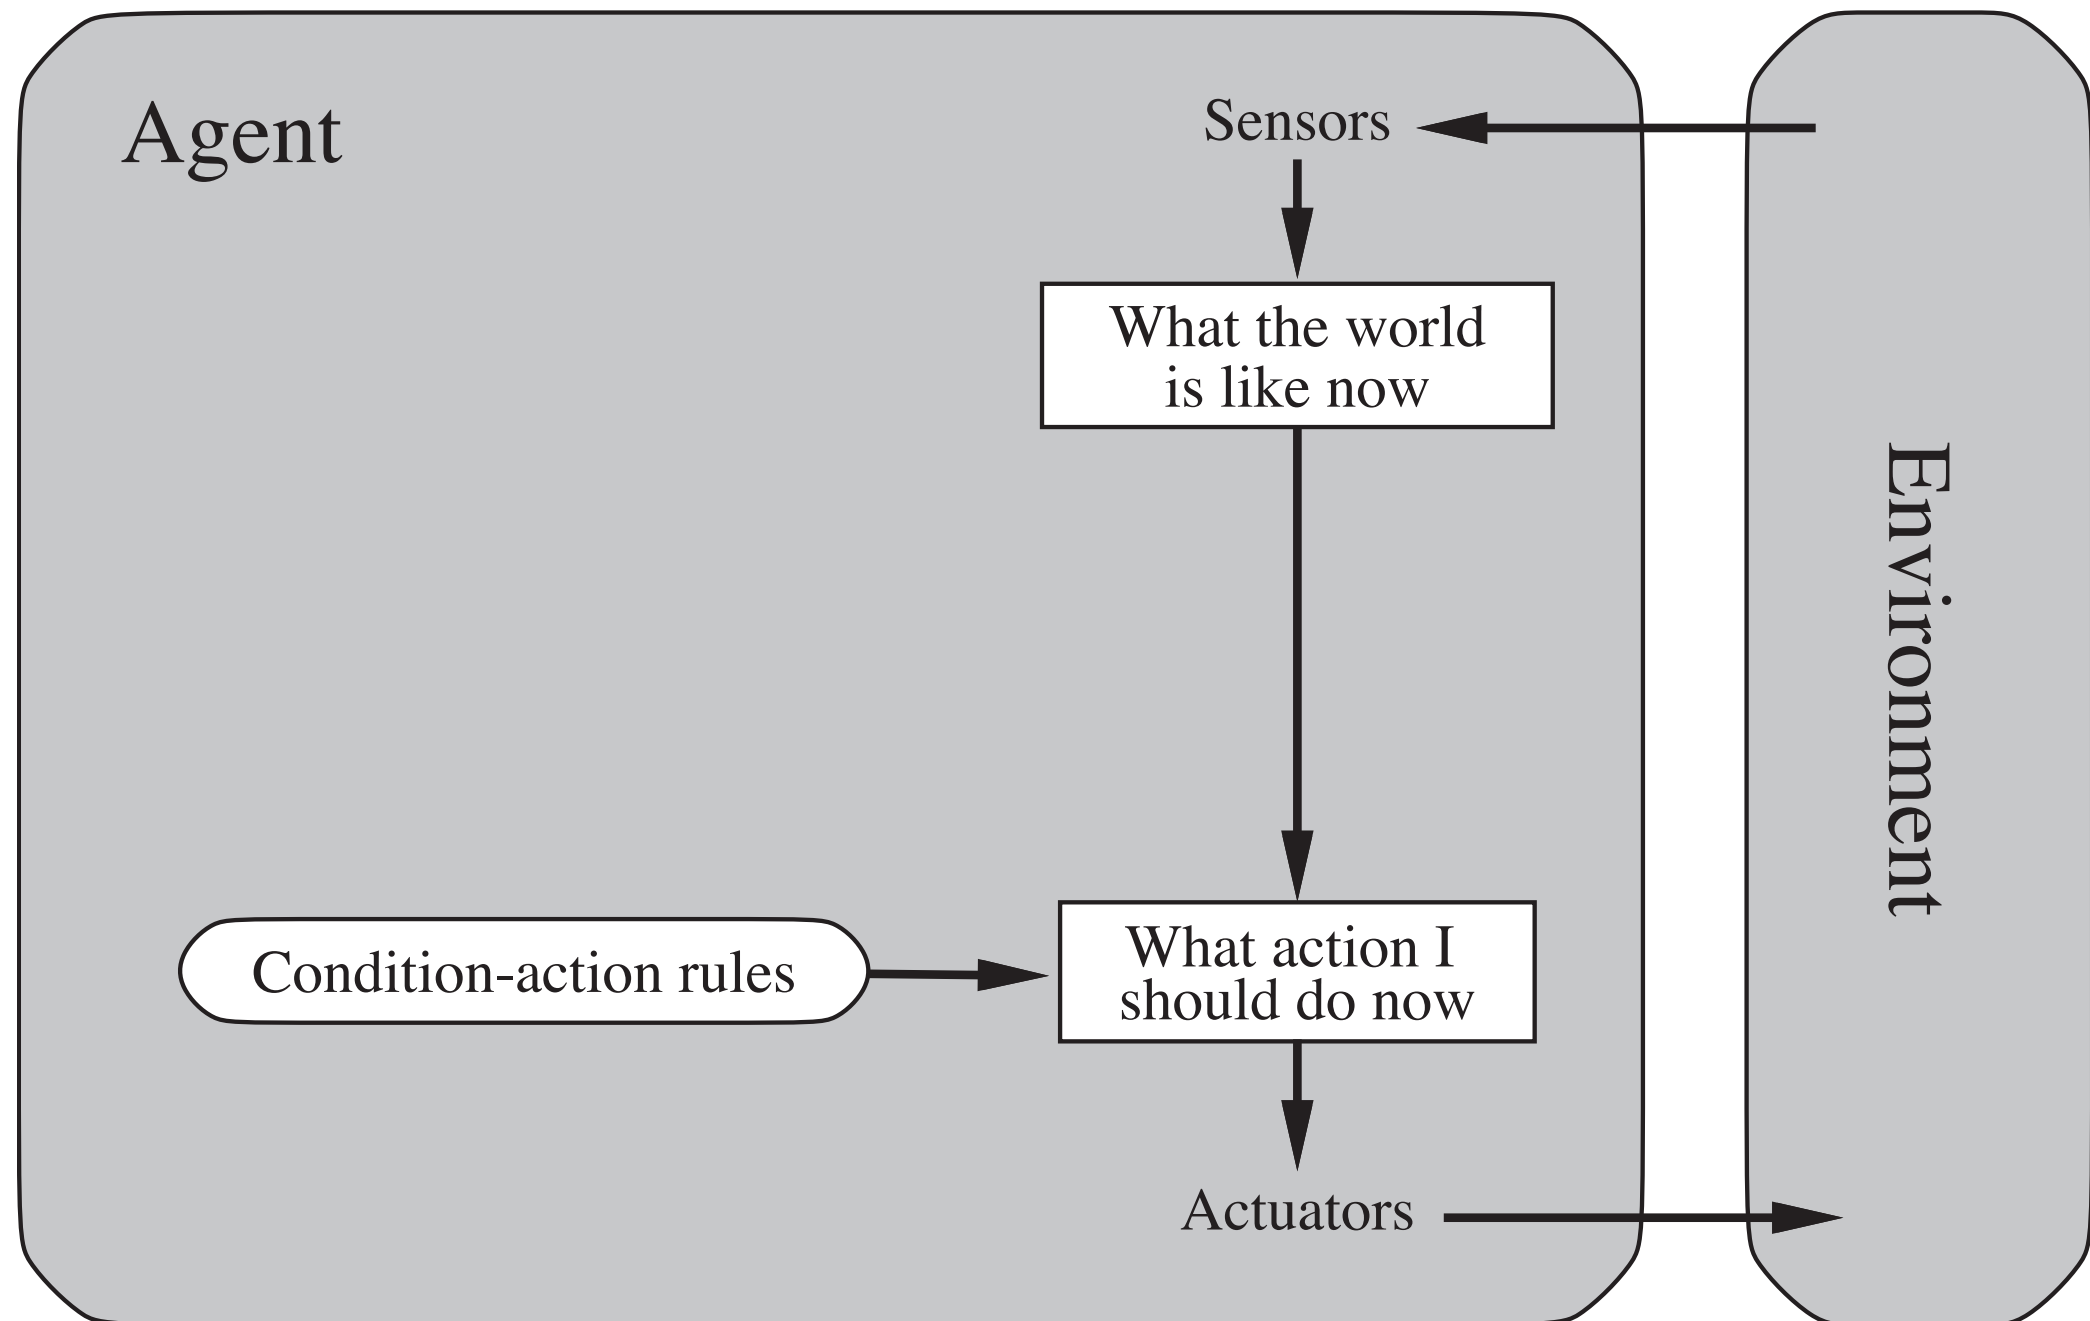

Environment Types

	Mahjong solitaire	Mahjong	Recommender system	Taxi	Real world
Fully or partially observable					
Single agent or multi-agent					
Deterministic or stochastic					
Static or dynamic					
Discrete or continuous					
Episodic or sequential					

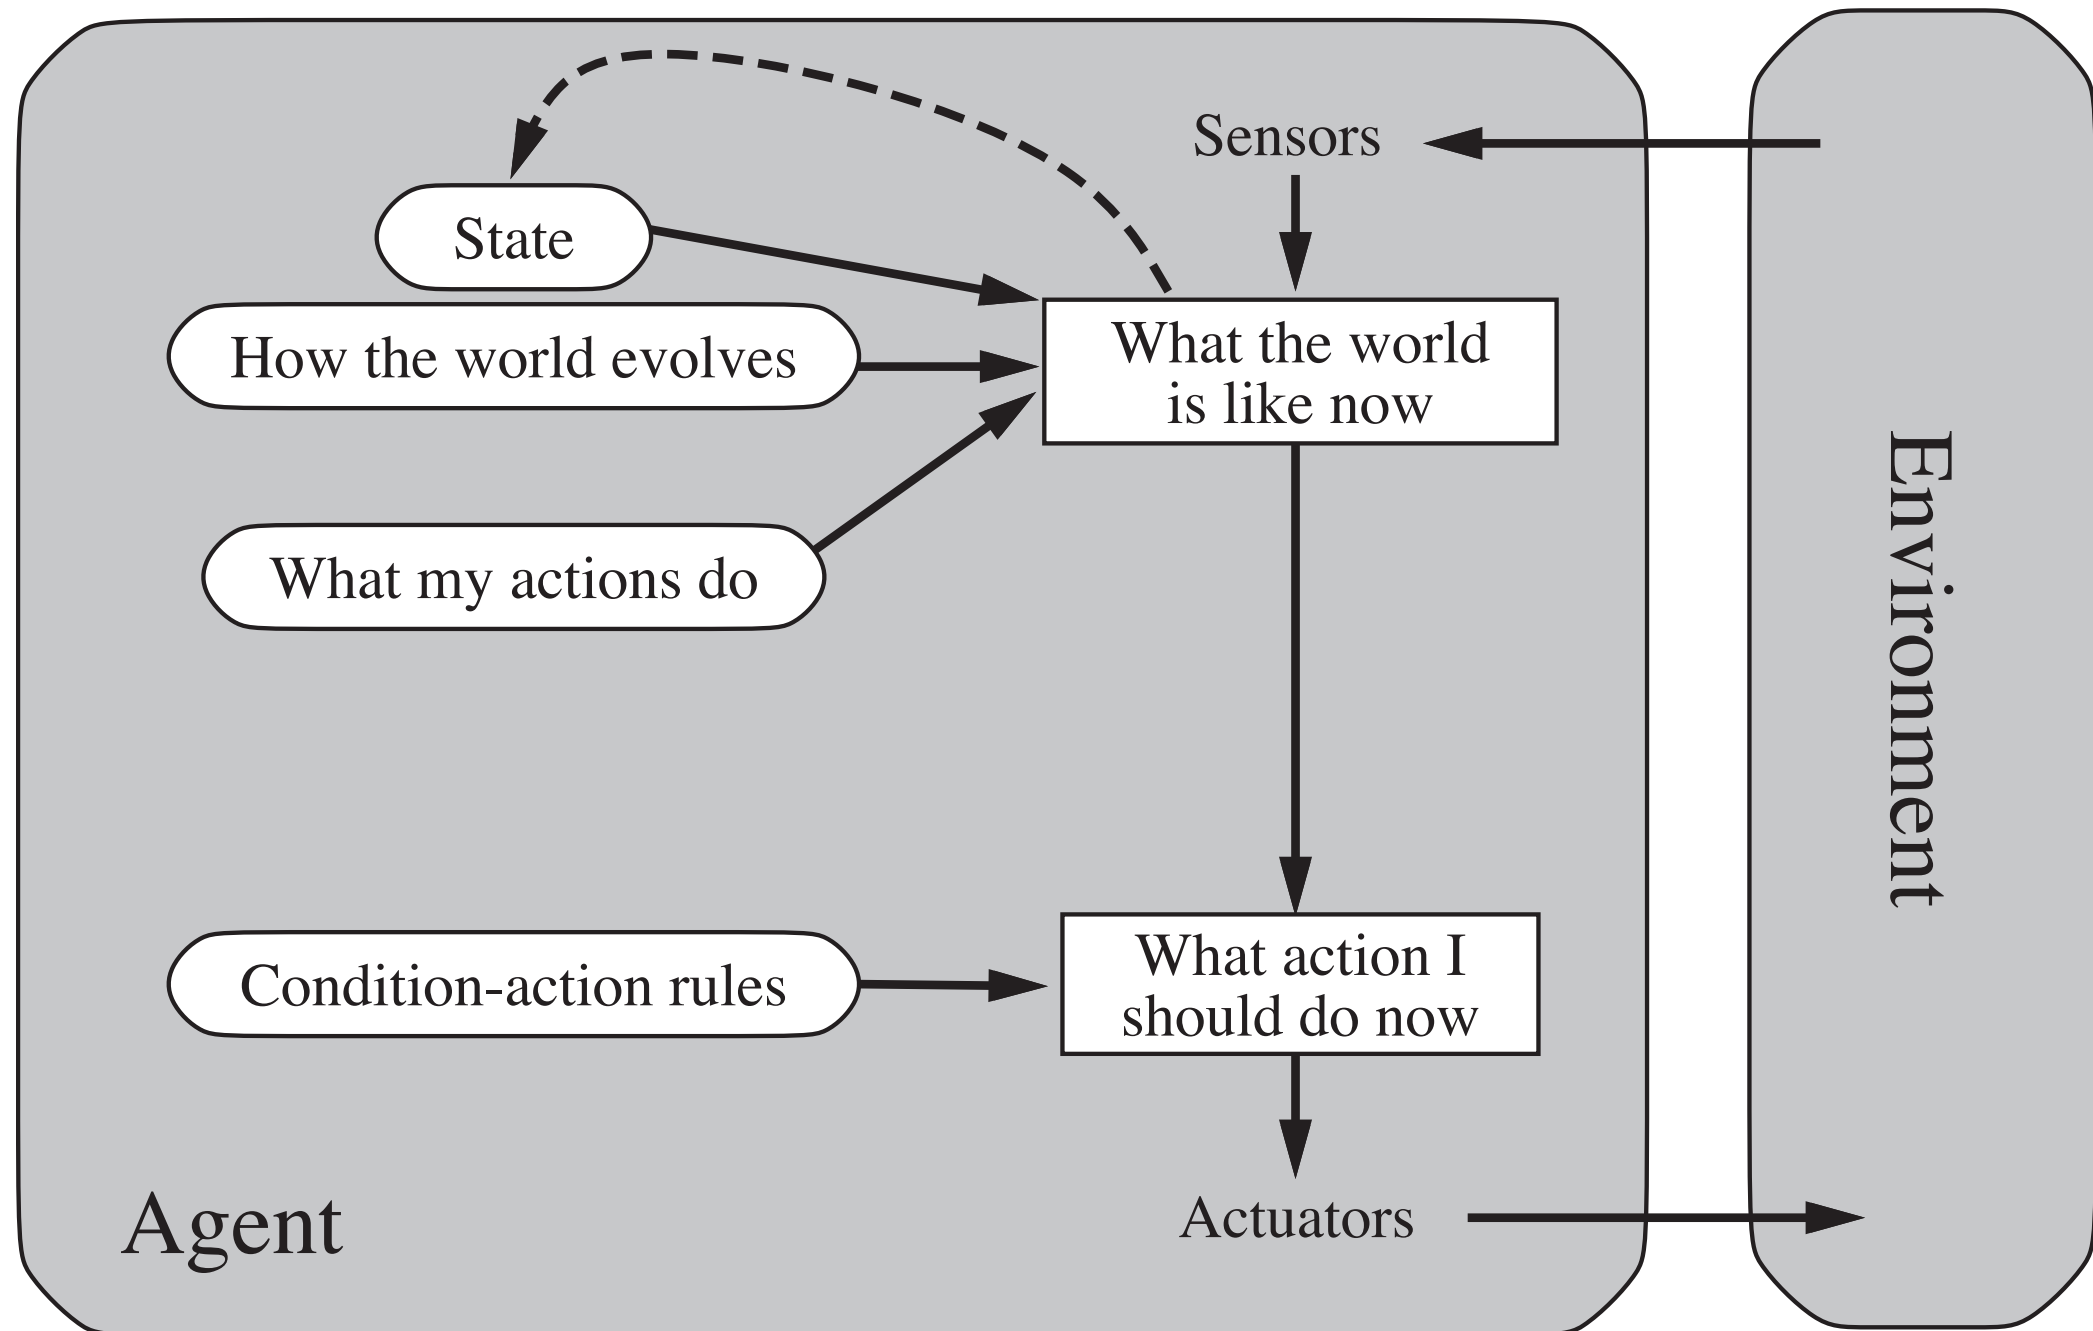

Different Types of Agents

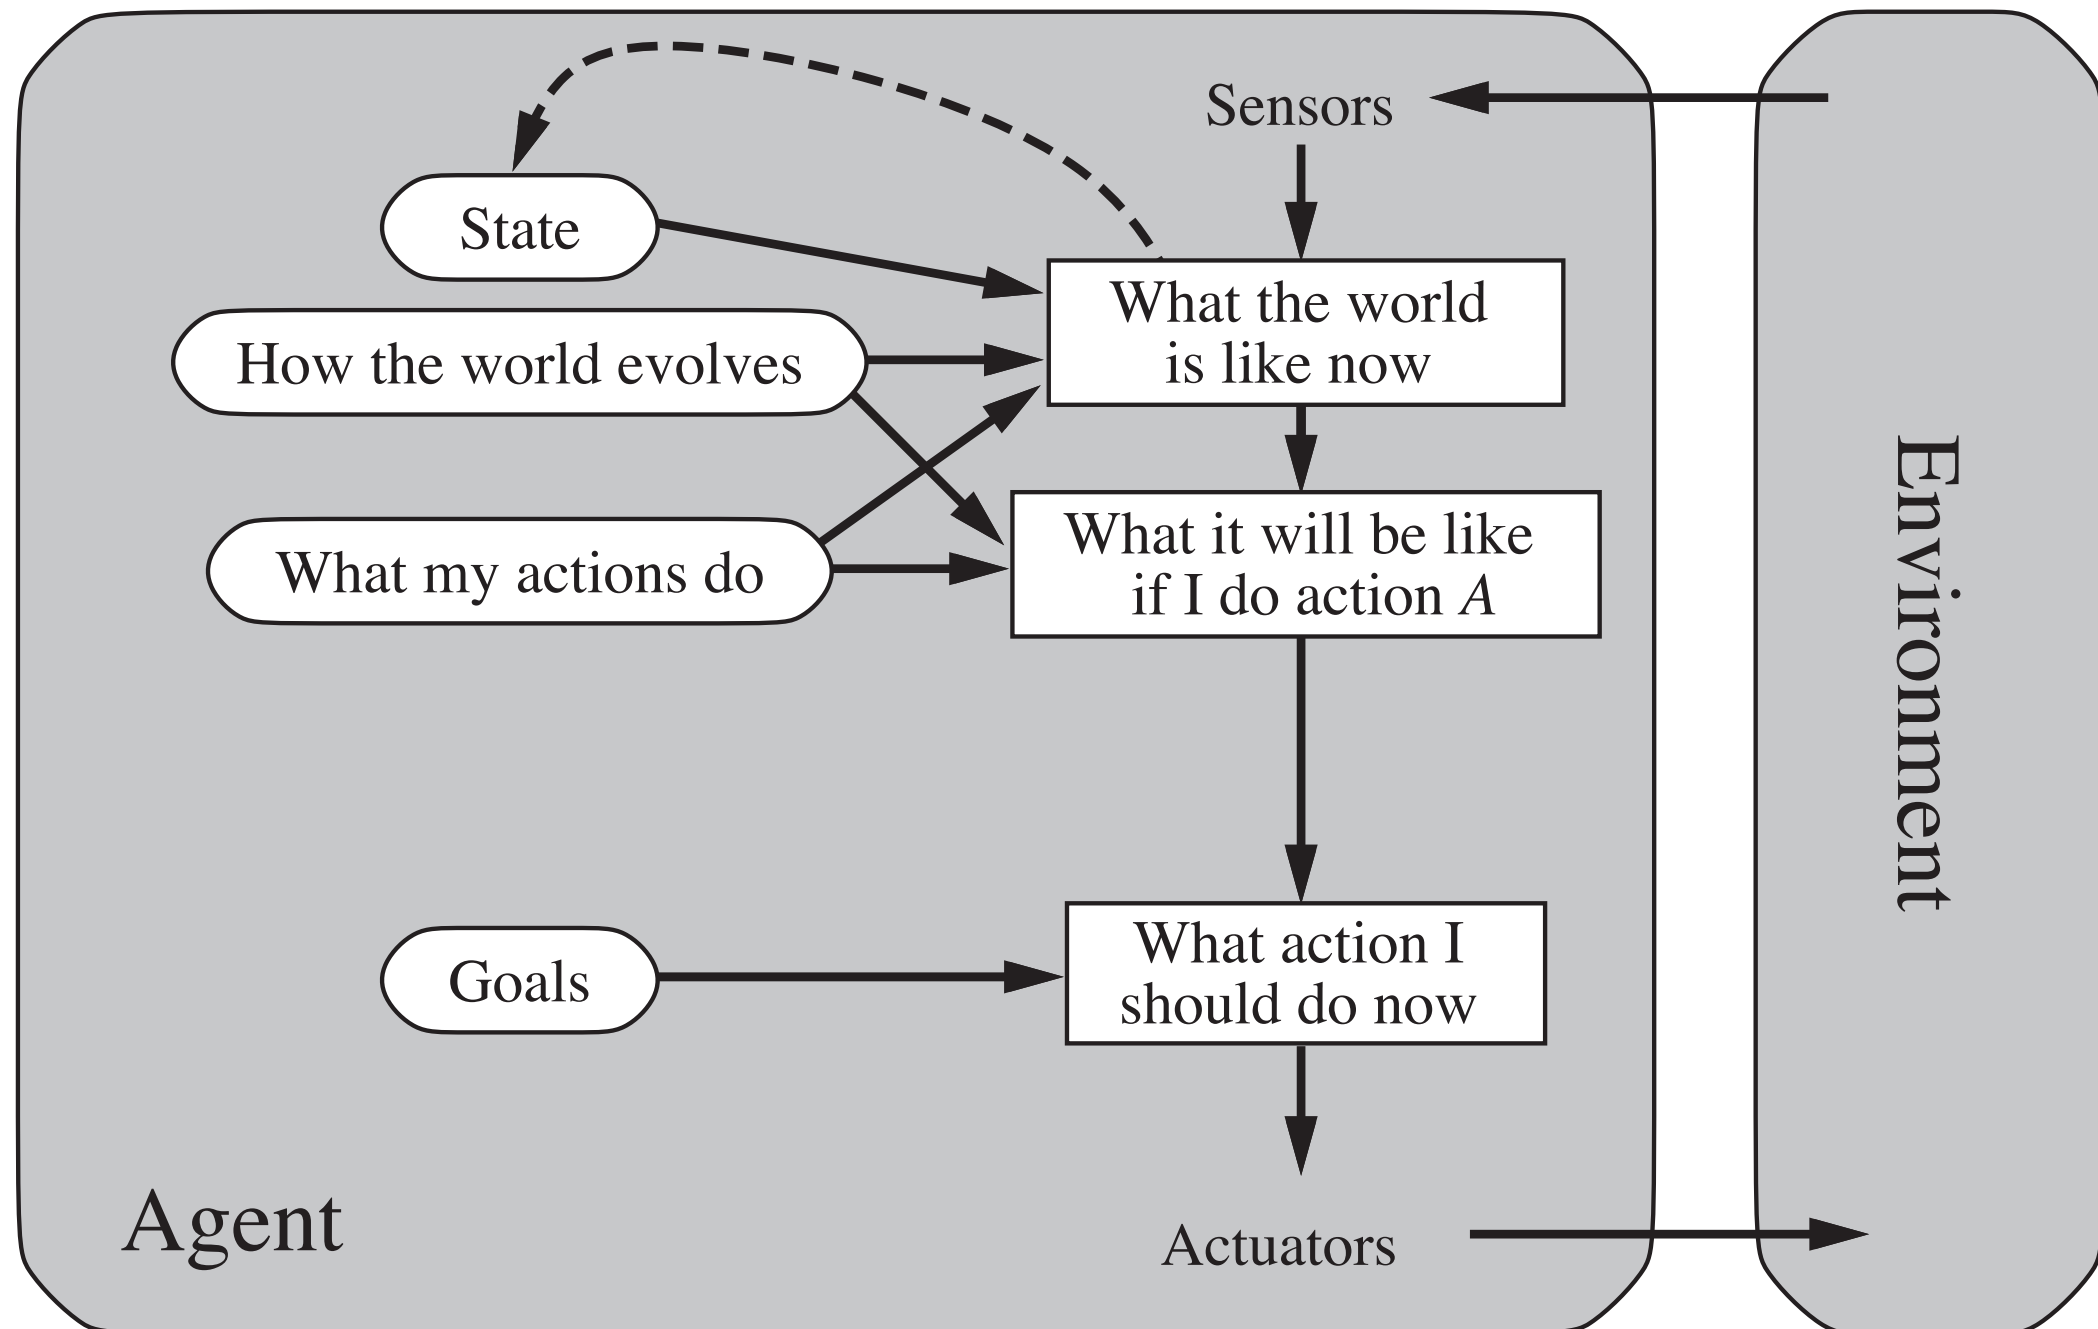

Simple Reflex Agents

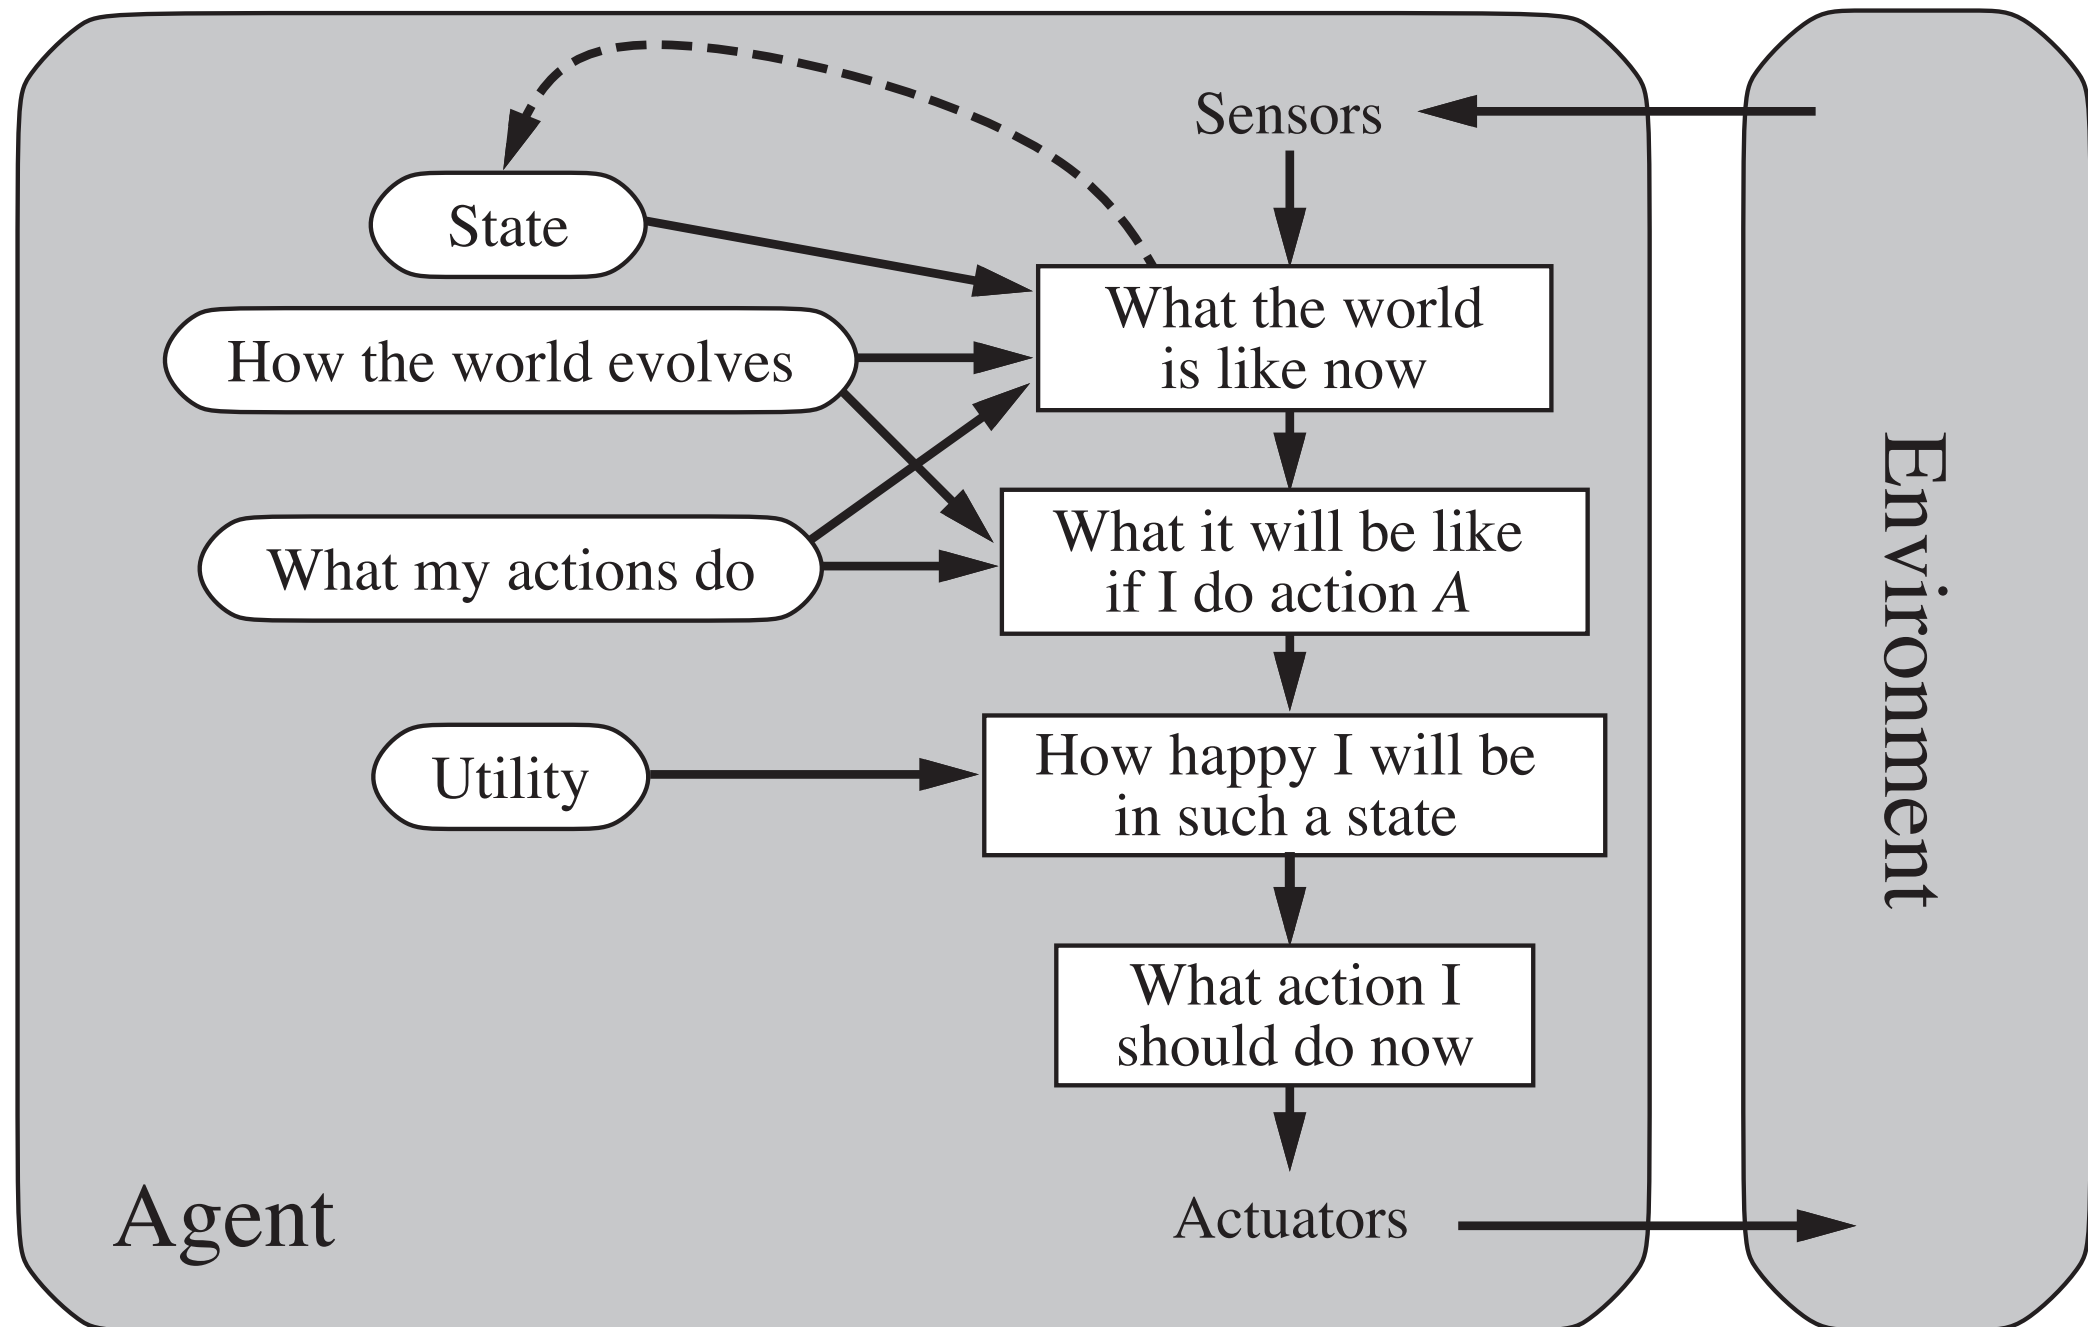

Model-based Reflex Agents

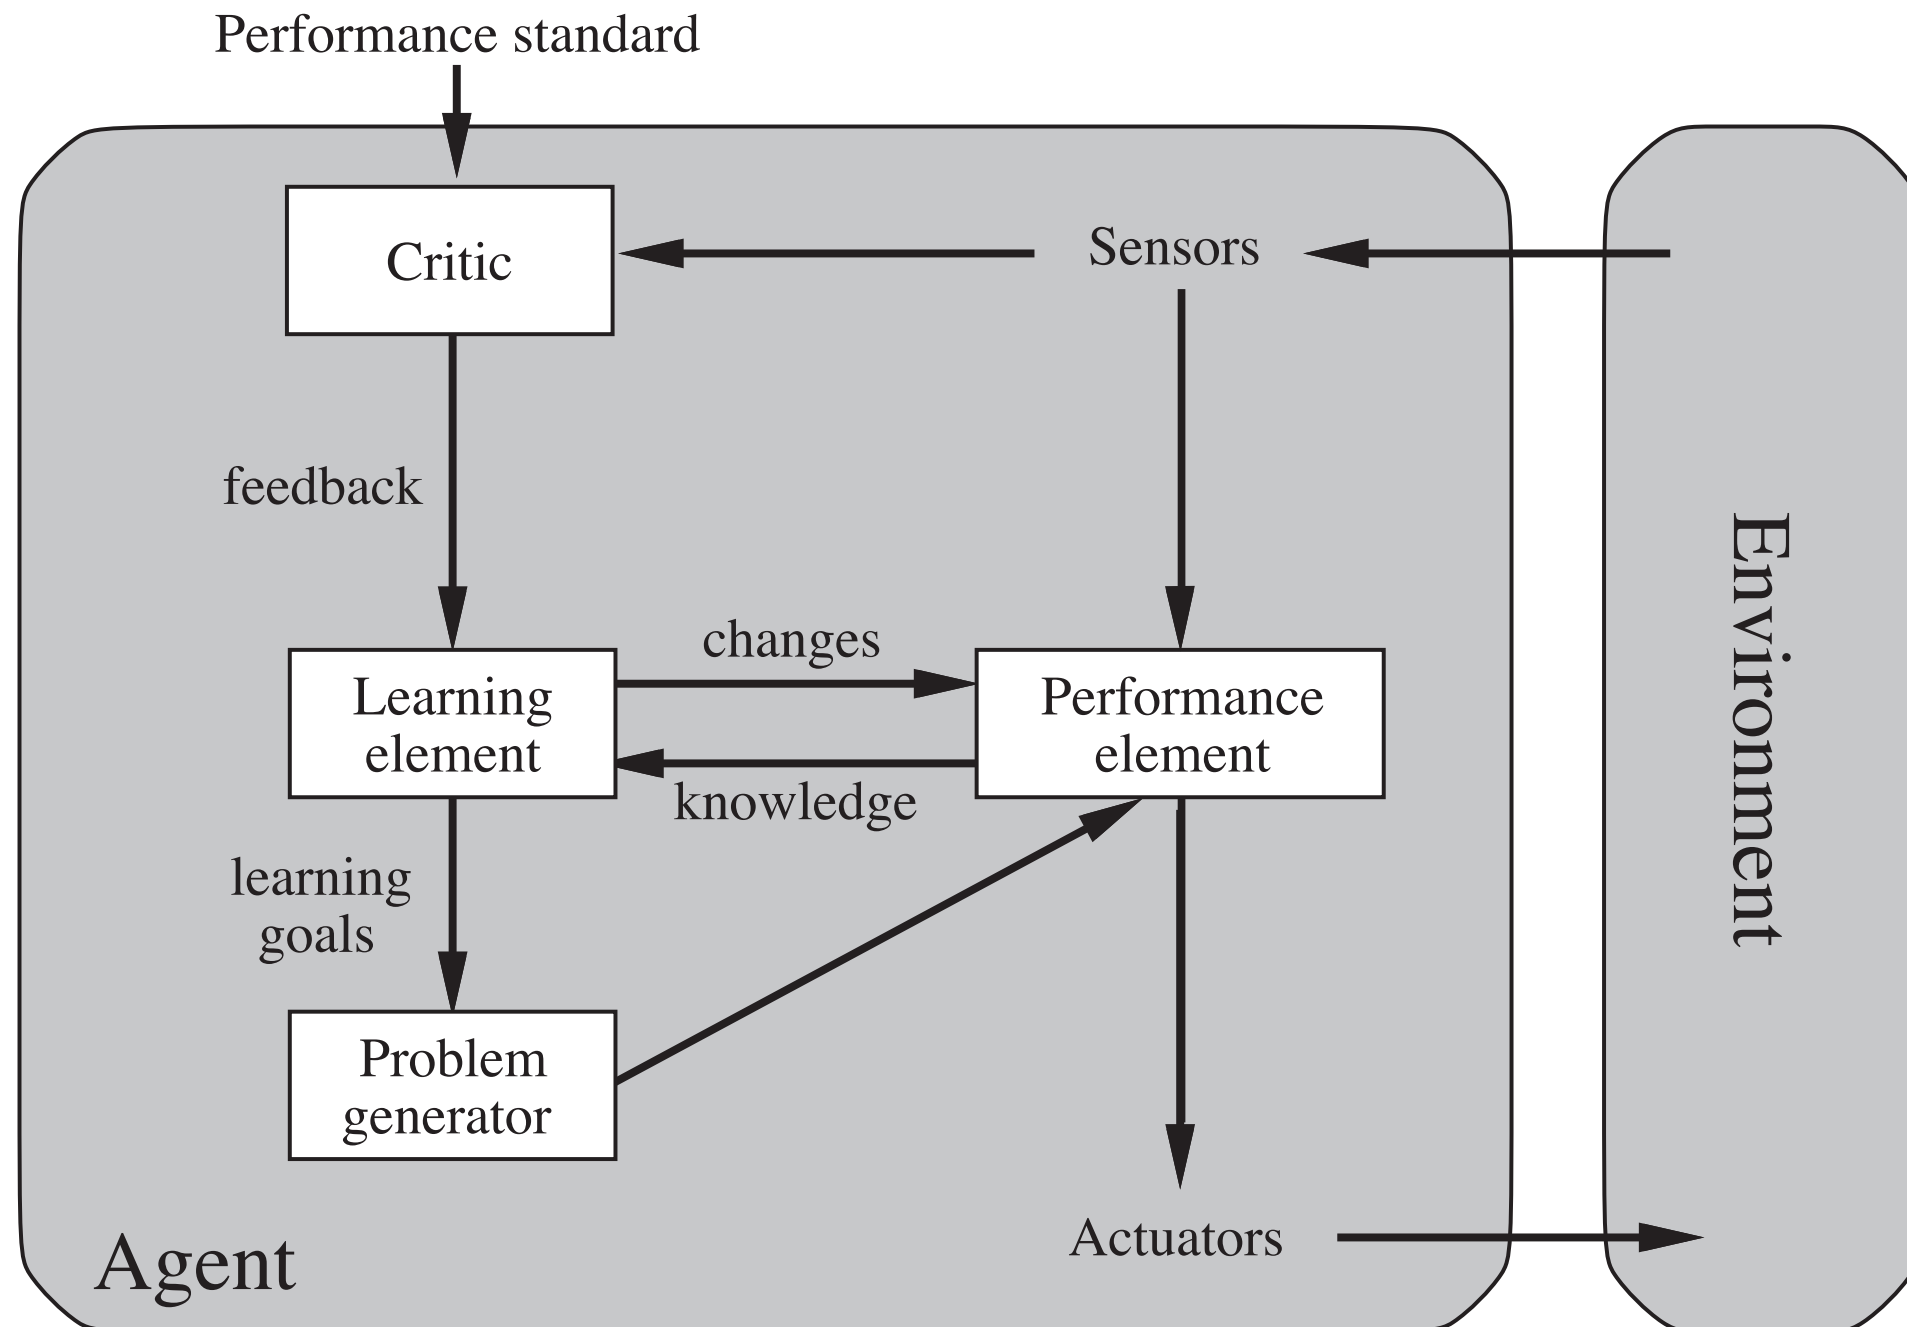

Goal-based Agents

Utility-based Agents

Learning Agents

Overview of Complexity Theory

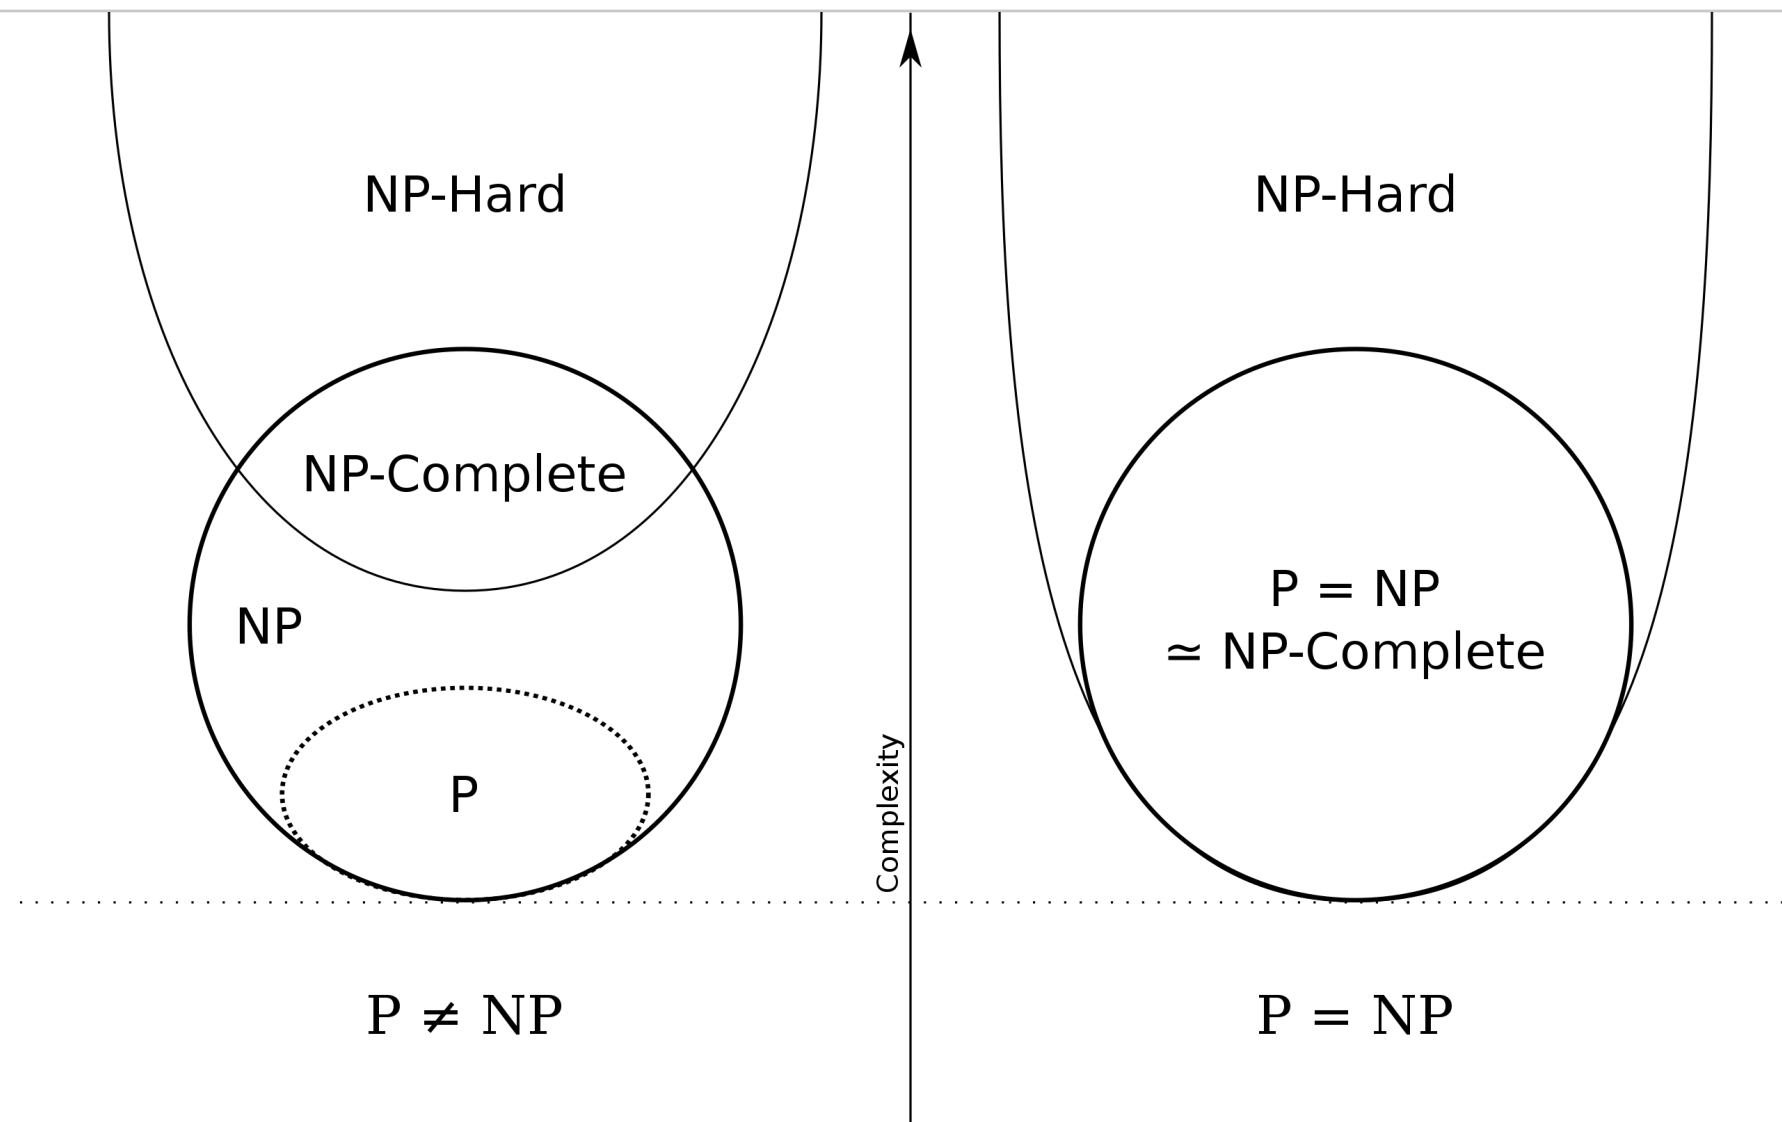

- ❖ Measure of difficulty wrt size of problem instance
- ❖ Problem vs algorithm complexity
- ❖ Space vs computational vs sample complexity
 - ❖ $O(1) \subset O(\log(n)) \subset O(\sqrt{n}) \subset O(n)$
 - ❖ $O(n \log(n)) \subset O(n^{1+\alpha}) \subset O(2^n) \subset O(n!)$
 - ❖ 2^{100} on machine $1\text{e}9$ op/sec requires $4\text{e}13$ years

Important Complexity Classes

- ❖ **Class** = set of problems; **Problem** = set of instance of problem
- ❖ **P**: problems that can be solved in polynomial time $O(n^k)$
 - ❖ Shortest path problem, linear programming, matching
- ❖ **NP**: problems where if solutions can be verified in polynomial time
 - ❖ Traveling salesman problem, Boolean satisfiability problem

Million Dollar Question: $P=NP$?

- ❖ NP -hard = as hard as NP
- ❖ NP -complete = hardest problems in NP

Some Other Complexity Classes

- ❖ PSPACE: problems that can be solved using polynomial amount of space
- ❖ EXPTIME: problems that can be solved in exponential time $O(2^{p(n)})$

For More Information
